

AI Workflow Audit

FL-01 | AI Workflow Audit and Tool Setup | FlyRank AI Internship | Week 1

Task Classification Table

#	Task	Classification	Rationale
1	Reviewing DLD lecture notes	Just me	Retention comes from active recall, not reading a summary
2	Solving Boolean algebra / K-map problem sets	Just me	The struggle is the skill-building; AI shortcuts the learning
3	Debugging Logisim circuit designs	Collaborate with AI	AI spots logic errors fast, but I verify against truth tables myself
4	Writing project reports (e.g. Voting Machine report)	Delegate to AI with review	AI drafts structure/prose fast; I check technical accuracy before submitting
5	Generating formatted PDFs via Python/ReportLab	Delegate to AI with review	Code works reliably, but I test output before sharing
6	Coordinating tasks with group members	Just me	Requires real negotiation, accountability, and trust-building
7	Making flashcards / study summaries for exams	Collaborate with AI	AI speeds up creation; I verify against textbook for accuracy
8	Debugging assignment code (other CS courses)	Collaborate with AI	Faster iteration with AI, but I need to understand the fix, not just paste it
9	Proofreading written assignments/reports	Delegate to AI with review	Catches typos/clarity issues well; I do a final read for voice
10	Searching for reference material/explanations	Collaborate with AI	Good first pass, but I cross-check against course material
11	Scheduling weekly study blocks	Fully automate	Low-stakes, rules-based, no judgment needed
12	Drafting emails to professors/TAs	Delegate to AI with review	AI gets tone/structure right; I add specifics and send myself
13	In-class note-taking	Just me	Handwriting/typing live notes builds understanding as I go
14	Preparing presentation slides for project demos	Delegate to AI with review	AI structures content fast; I adjust for accuracy and delivery style

Three Target Tasks for FL-02–FL-04

1. Project report generation (Task 4)

Done well = Final PDF report matches the rubric's required sections, contains zero factual/technical errors about the circuit logic, and needs no more than one round of manual edits before submission.

2. Debugging circuits/code (Tasks 3 & 8)

Done well = AI correctly identifies the root cause (not just a symptom) and I can explain why the fix works, verified by a passing simulation/test run.

3. Exam study material creation (Task 7)

Done well = Flashcards/summaries cover 100% of the syllabus topics for that unit, contain no inaccuracies when checked

against my notes, and I can score 80%+ on a self-quiz using them.

Toolkit & Claude Project Setup

Accounts created: Claude, ChatGPT, and Anthropic Academy (free tiers)

Enrolled in AI Fluency: Framework & Foundations (Anthropic Academy) and completed Module 1.

Claude Project — Custom Instructions

"I'm a 2nd-semester BSCS student focused on Digital Logic Design this term. I want direct, technically accurate answers — flag anything you're unsure about rather than guessing. Current goals: strong grades in DLD, building genuine understanding (not just copy-paste answers), and getting faster at report/documentation writing for group projects.
